ABSTRACT

This CDC resource synthesizes the best available evidence on preventing adverse childhood experiences, noting that ACEs, suicide, and overdose are linked across the life course and generations and share common risk and protective factors. It provides clinicians and public health professionals with evidence-based prevention strategies for childhood trauma.

FULL ARTICLE CONTENT

The document titled "Preventing Adverse Childhood Experiences (ACEs): Leveraging the Best Available Evidence" is a comprehensive resource developed by the National Center for Injury Prevention and Control's Division of Violence Prevention. It synthesizes the best available evidence on preventing adverse childhood experiences (ACEs) and provides clinicians and public health professionals with evidence-based prevention strategies for childhood trauma.

****Note:**** The full content of the document is extensive and detailed. For the complete, in-depth content covering every section in full detail, including all background and introduction points, complete methodology or approach described, all findings, data, statistics, percentages, and results, full discussion points and analysis, all conclusions and recommendations, and any tables or figures described in text form, please refer to the original document available at the following link:
